\textsuperscript{1}Max Planck Institute for Informatics \textsuperscript{2}Intel Visual Computing Institute \textsuperscript{3}University of Bath

Contributions

- Egocentric inside-in camera rig
- Motion capture algorithm (generative + discriminative)
- Automatic database (annotation & augmentation)

Advantages

- Free roaming
- Succeeds in crowded scenes
- Easy to use, little intrusion

Capture approaches

- Inside-in, outside-in, inside-out
- Optical, accelerometer, exoskeleton
- Head-mounted, external, suit-based
- Full-body pose, hands, faces, surface
- Marker-less, active or passive markers

Generative model

Volumetric model + skeleton

Lens model

Database creation

Multi-view motion capture system

EgoCap camera rig

Discriminative model

External view

Detections (CNN)

Detection maxima

Accuracy

Results

Object interaction

Crowded and confined scenes

Outdoor and large scale

Funding: ERC starting grant CapReal (335545)
